

# Biodiversity Heritage Library Australia: unlocking the treasures in Australia's biodiversity literature

BHL Australia is a national project working to digitise Australia's biodiversity heritage literature and make it freely accessible online

The Biodiversity Heritage Library (BHL biodiversitylibrary.org) is the world's largest online library of biodiversity literature and archival materials. The project is a global consortium of 523 contributing libraries who have together digitised over 59 million pages of the world's biodiversity literature, all of which is freely accessible online, for everyone. BHL Australia joined the global consortium in 2010.

>> Digitised copies of Australia's biodiversity literature are now available through the BHL website. Fach publication is assigned a digital object identifier (DOI) so it can be easily referenced. Image credit: BHL Australia

#### THE DUCK-BILLED PLATYPUS.

**\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*** GENERIC CHARACTER.

Mouth shaped like the bill of a Duck. Feet webbed.

The animal exhibited on the prefent plate constitutes a new and fingular genus, which, in the Linnæan arrangement of Quadrupeds, should be placed in the order Bruta, and should stand next to the genus Myrmecophaga.

Of all the Mammalia yet known it feems the most extraordinary in its conformation; exhibiting the perfect refemblance of the beak of a Duck engrafted on the head of a quadruped. So accurate is the fimilitude that, at first view, it naturally excites the idea of fome deceptive preparation by artificial means: the very epidermis, proportion, ferratures, manner of opening, and other particulars of the beak of a floveler, or other broad-billed species of duck, presenting themselves to the view: nor is it without the most minute and rigid examination that we can perfuade ourfelves of its being the real beak or fnout of a quadruped.

The body is depreffed, and has fome refemblance to that of an Otter in miniature: it is covered with

## Australian biodiversity literature

The BHL Australia project was one of the very first collaborative projects established by the Atlas of Living Australia (ALA ala.org.au). It is funded and operates as a co-investment between Museums Victoria and the ALA.

BHL Australia now supports 37 contributing organisations from every state and territory across the country. These include Australia's state museums, herbaria and libraries, as well as smaller organisations such as royal societies, field naturalist clubs and other learned societies and community groups, who may never have had the resources to do this critical work without this support.

This work has unlocked treasures such as the first published descriptions the Echidna https://doi.

### org/10.5962/p.304529

(1792), and the Platypus https://doi.org/10.5962/p.304567 (1799). These descriptions are now freely accessible, easily discoverable and persistently citable (via DOIs) on the BHL website.

#### Making our biodiversity literature accessible and discoverable

The BHL Australia team prioritises the digitisation of Australian-published biodiversity literature. The literature scanning operation is housed at Melbourne Museum, where journals, monographs, archival material and grey literature are digitised. A significant proportion of the scanning, post-processing and metadata addition is undertaken by a team of dedicated BHL volunteers, many of whom have been with the project since the very beginning.

Providing free, online access to biodiversity literature greatly benefits researchers and decision makers working in the fields of taxonomy (naming and categorising species), ecology and conservation. In particular, providing access to the first descriptions of species greatly benefits the taxonomic community as all descriptions of new or revised species must be referenced to species concepts that have been put forward before.

Assigning DOIs (digital object identifiers) is an important component of BHL Australia's work. DOIs make the historic literature discoverable; they provide a unique and permanent link to each scientific description online, enabling authors, publishers, and taxonomic databases (such as the

ALA) to persistently link to (and find) that literature.

Historic literature is critical to our understanding of Australia's biodiversity, particularly our understanding of changes in species distribution and abundance. Since 2010, BHL Australia, and our evergrowing number of Australian contributors, have made almost 400,000 pages of Australia's biodiversity literature openly accessible online. You can access BHL Australia at www.biodiversitylibrary. org/collection/bhlau or via Twitter @bhl\_au.
